

ASX RELEASE

14 October 2014

Advanced Braking Technology announces New Products

- **New SIBS[®] 4 brake being released in December 2014**
- **SIBS[®] 4 has improved functionality and smaller foot print**
- **SIBS[®] 4 braking solution developed for the widely used Ford Ranger**
- **Hilux, LandCruiser, Isuzu and Hino will migrate seamlessly to SIBS[®] 4**

Advanced Braking Technology (ASX: ABV) ('ABT' or 'the Company') is pleased to announce the development and release of SIBS[®] 4, the next generation of ABT's industry leading range of mining vehicle brakes.

SIBS[®] 4 offers customers a significant number of improvements over the SIBS[®] 3 range including:

- Substantially reduced size of the EMMA pump assembly, providing greater flexibility in vehicle mounting
- In-vehicle monitoring of hydraulic fluid levels
- Highway speed isolation (HSI) as a further protection against accidental activation of the brake at high speed
- An engine oil pressure sensor that enables automatic application of the emergency brake in the event of an engine stall.

SIBS[®] 4 is being released in December 2014 in conjunction with the newly developed SIBS[®] 4 brakes for the Ford Ranger. The Ranger is now used widely in mines in Australia and Africa and ABT is responding to an increased level of demand for their product to support it.

Earlier releases of SIBS[®] brakes will continue to be supported, however all new orders for existing models including LandCruiser, Hilux, Isuzu and Hino will adopt the SIBS[®] 4 improvements from December 2014.

ABT's Managing Director, Graeme Sumner commented, "It is evident there is a lot of customer demand for our products to cover a wider range of vehicles, both with wheel end solutions and driveline brakes. We are responding to that demand as quickly as possible, with further product announcements expected over the next 12 months."
